Recommendations

These will give you a good starting point for a variety of photographic situations. Your settings will vary according the light, lenses, and other equipment you are working with. You'll likely find many settings that you want to adjust differently as you develop your own style.

Super Simple

Everything on auto, then use "Flexible Program" to adjust the shutter speed and aperture combinations. The camera will use all focus points to achieve focus. Be careful of the camera focusing on subjects in the foreground.

Landscape

While in Manual exposure (M) you'll likely want a lot of depth-of-field to keep everything in focus. The shutter speed won't matter if the wind isn't blowing too much and you are on a tripod (which you should be). Metering shouldn't matter too much if you shoot a test photo then check the histogram. Another good option would be Aperture Priority (A): set the aperture to the f/11 - f/16 range and if handholding, make sure you can hold the camera steady for the given shutter speed.

Portrait

While in Manual exposure (M) choose a shallow depth of field to separate your subject from the background. Keep the ISO as low as possible for best quality. Set WB then possibly add a bit of fill flash (try a -1 Flash Exposure Compensation) to fill in the shadows and give a little sparkle to the eyes. Focus on the nearest eye, lock focus in, and recompose into a pleasing frame. A second option would be to be in Aperture Priority (A) while setting a wide aperture like f/1.4 - f/4.

Action

Manual exposure will give you the most consistent results unless you are shooting in both direct sun and shade. Keep a shutter speed of 1/500 or faster to stop the action. A fast lens (e.g. f/2.8) is a great benefit here. The ISO will most likely need to be 400 or higher. Indoor sports will often require ISO 3200 or more. Focus needs to be put into the AF-C mode. A larger focus area, "Dynamic-area AF 25", will make tracking moving subjects easier. Use the continuous shutter release option and shoot in short bursts. Another option is to be in the Aperture Priority (A) mode while setting a "fast" aperture (f/2.8 - f/4).

General Photography

The Aperture Priority (A) mode can be easily shifted to any available aperture/ shutter speed combination. Set an ISO as low as you can until you decide you need a faster shutter speed. Use exposure compensation, as necessary, for dark or bright subjects. Single point focus allows for precise control of focus selection.
